We consider the surface defined by the polyhedral divisor

$$\{\frac{1}{2}\}\otimes P_0 + \{0, \frac{1}{2}, 2\}\otimes P_1 + \{0, \frac{1}{2}\}\otimes P_3$$

with markings  $\mathbb{Q}^{\pm}$ . By contracting the curve corresponding to  $2\otimes P_1$  we get a  $D_4$  singularity. So this is arising as a log terminal extraction from a non cyclic quotient singularity. This surface has one  $\frac{1}{3}(1,1)$  and one  $\frac{1}{8}(1,5)$  and  $h^0(-K_X)=4$ .
